EVO PTT BENCHMARK

CONCLUSION

* The data shown on the benchmark above were all performed with the Android F22+ device, playing the same 60 second initial part of a song.

* The size is measured in Kilobytes (KB) and the procedure of account creation in each app is not counted since it wastes more data and it favors our solution.

* Using the latest voice and audio compression CODECs, our solution consumes 51% less data than ProPTT2, 48% less than Zello PTT and 12% less than the older based platform QR-PTT Push To Talk application.

*ProPTT2 exposed some bugs during the testing, with the app not properly shutting down and making a buzzing sound when changing to Spanish language.

* EVO PTT offers the cleanest and most intuitive UI of all, with the LOGIN procedure to be faster and more straightforward even to inexperienced Android users.

*Only EVO PTT and ProPTT2 use the kernel features of Android Walkie Talkie devices for hardware PTT buttons and in addition to that, EVO PTT takes advantage of the hardware SOS button as well, so that these functions can be used even when the application is in the background or the device screen is turned off resulting in less battery consumption.

*The original screenshot of the experiment is taken via a USB connection of the device to a PC using the “adb shell screencap –p” command and can be shown below:
